The first guided-wave components that employed signals in the form of light beams traveling along thin films were fabricated a little more than two decades ago. The parallel development of semiconductor lasers and the subsequent availability of low-

loss optical fibers made possible the implementation of completely optical systems for communications, signal processing and other applications that had used only electronic circuitry in the past. Referred to as integrated optics, this technology has been reinforced by utilizing electronic components that act as controlling elements or perform other functions for which the optical counterparts are not as effective. The broader area thus generated was aptly named optoelectronics and it currently represents a fascinating, rapidly evolving and most promising technology. Specifically, the amalgamation

of electronic and optics components into an integrated optoelectronics format is expected to provide a wide range of systems having miniaturized, high speed, broadband and reliable components for telecommunications, data processing, optical computing and other applications in the near and far future. This book is intended to cover primarily the optical portion of the optoelectronics area by focusing on the theory and applications of components that use guided optical waves. Hence all aspects of integrated optics are discussed, but optoelectronic components having primarily electronic rather than optical functions have not been

included. Each chapter has been written by experts who have actively participated in developing the specific areas addressed by them. Explains how to browse the Web, e-mail, chat, play games, create a Web site and Web graphics, and ensure security against viruses and hackers.
